

VALETON GP5 & GP-50

STARTER PACK

How to Import GalTone Studio Presets:

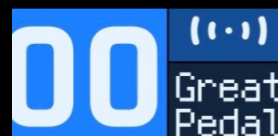

Thanks for ordering from Galtone Studio. This guide explains how to import our presets into the Valeton GP-5 and GP-50 using the Valeton Suite app.

Requirements:

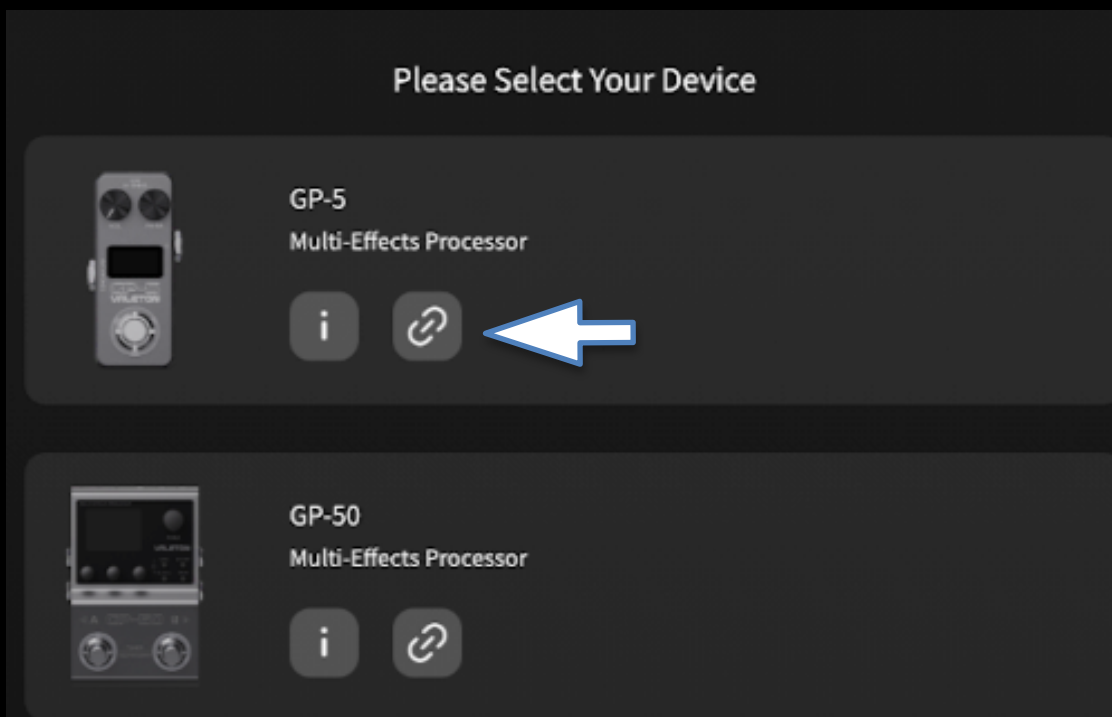

- Valeton GP-5 or GP-50 (firmware v1.0.3 or later)-
- Valeton Suite app (iOS/Android/macOS)
- NAM and preset files (included in the downloaded ZIP file)

VALETON GP-5:

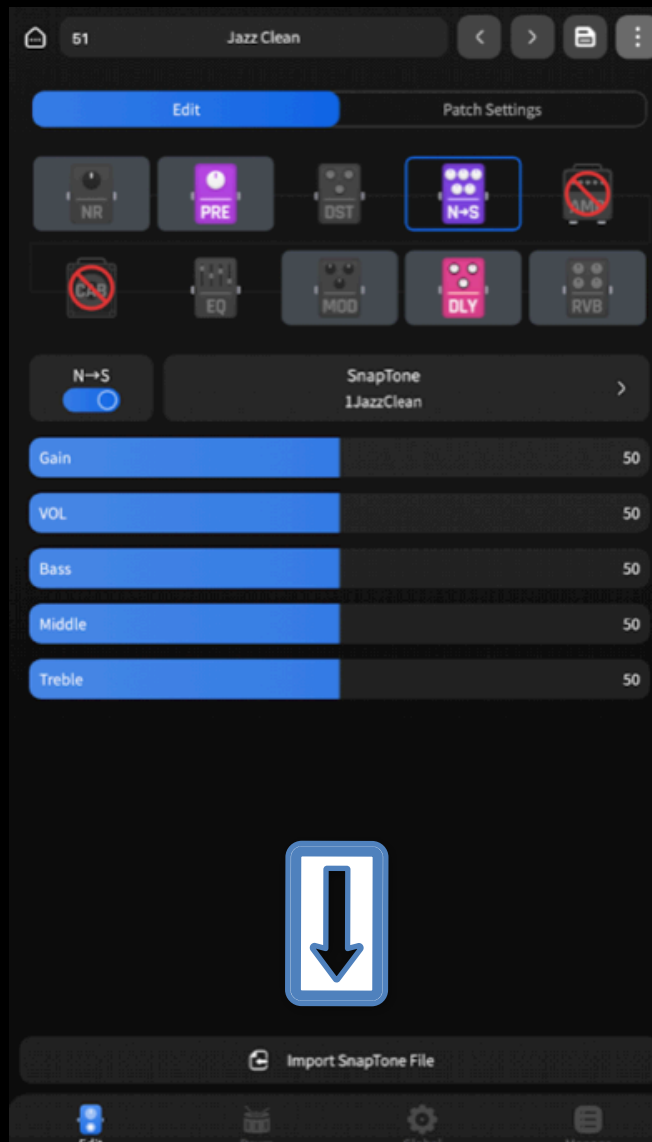

- 1) **Activate Bluetooth Mode on the GP-5.** On the main display, long-press the PARA knob to toggle Bluetooth pairing mode. A Bluetooth icon will appear, indicating it's ready.

- 2) **Connect via Valeton Suite App.** Open the Valeton Suite app on your phone or desktop. Select GP-5 as the device. Wait for the device to appear, then tap to connect.

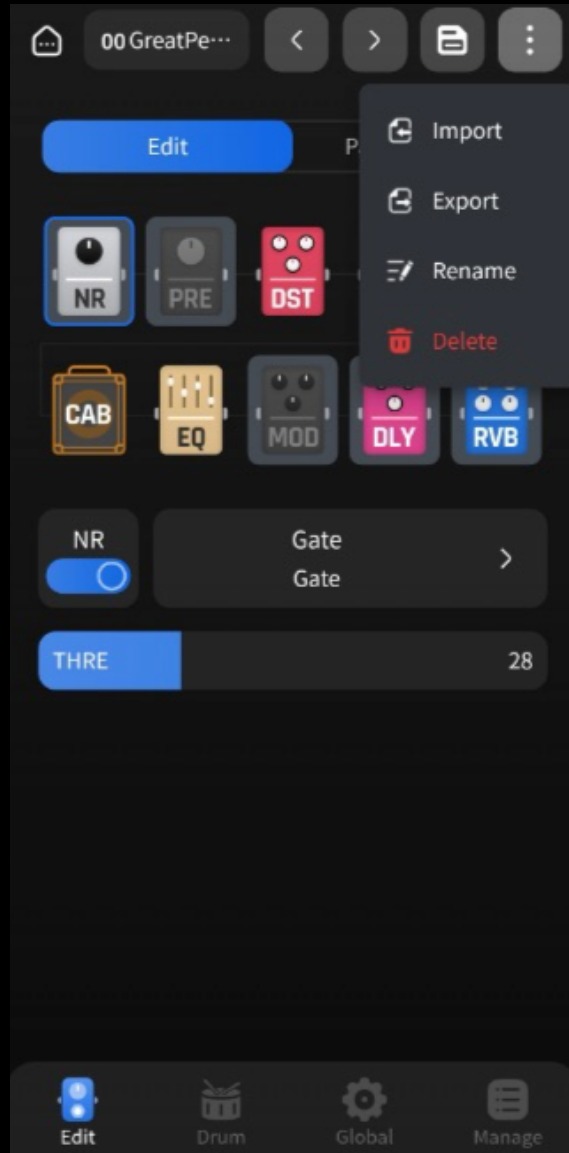

3) **Import NAM/SnapTone Files*** (if included in your pack). Once connected, click the '**N->S**' icon. Then select 'import SnapTone File'.

Import the NAM files provided with your pack (max 10 at once). It is highly recommended to use empty slots if available. To import NAM files, click **IMPORT**.

4) Importing Presets: Next step is to import presets included in a pack. In order to do that, go to the top right corner (3 dots), click, and hit IMPORT. After importing, the NAM file should be added automatically, but double-check to is everything is in place.

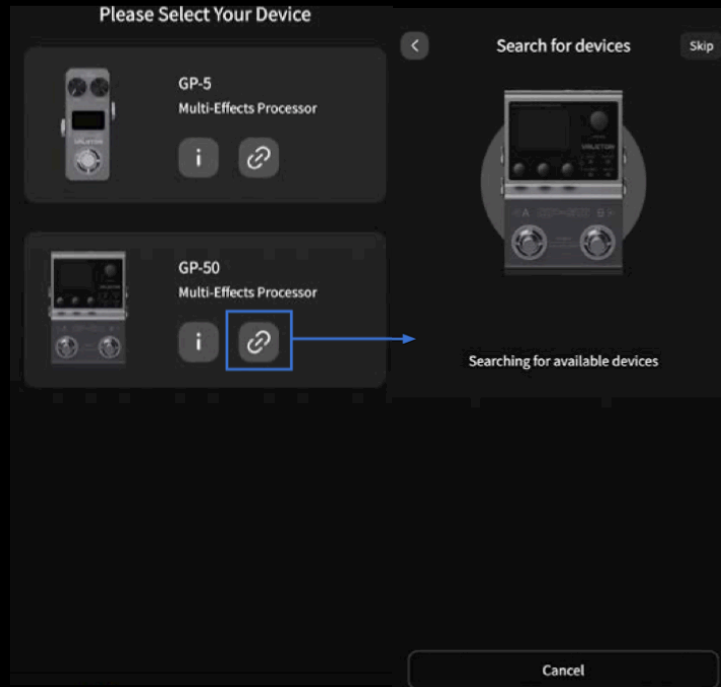

MAKE SURE TO IMPORT PRESETS FROM GP-5 PRESET FOLDER, NOT GP-50 PRESET FOLDER.

IMPORTANT: Most of our presets utilize the CTL switch, which lets you turn on/off up to three effects at once. This is mainly used for switching from rhythm to lead tones within a single preset. If you want to use that functionality, go to GLOBAL and change your FOOTSWITCH MODE to CTL.

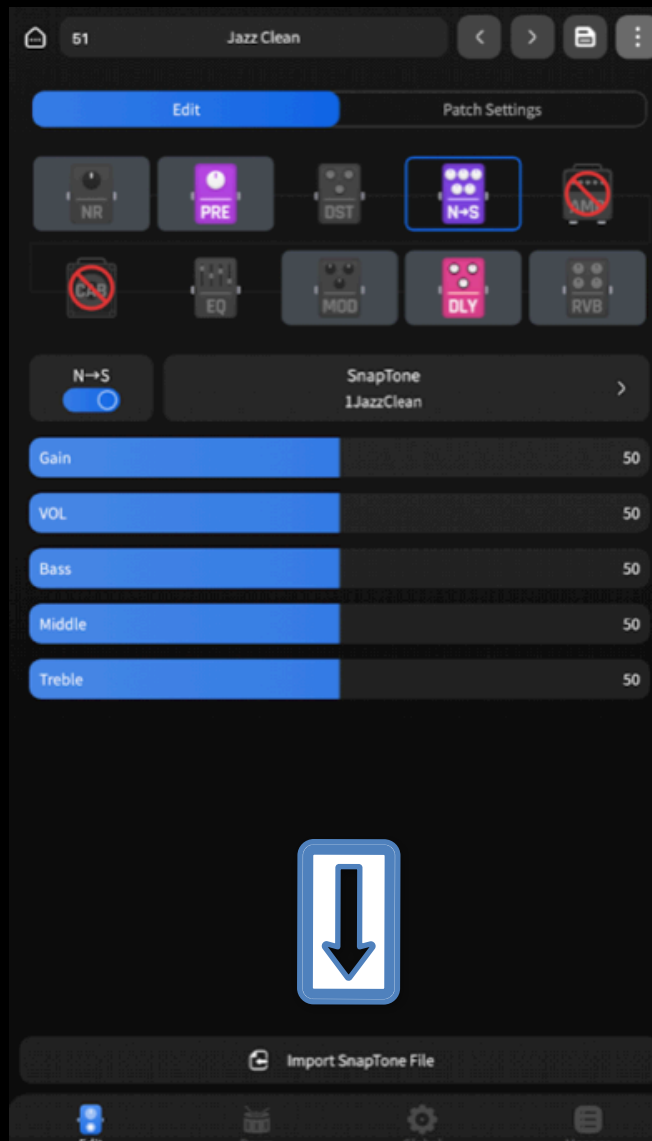

VALETON GP-50:

- 1) **Activate Bluetooth Mode on the GP-50.** On the main display, long-press **EXIT/BT** Button to toggle Bluetooth pairing mode. A Bluetooth icon will appear, indicating it's ready.
- 2) **Connect via Valeton Suite App.** Open the Valeton Suite app on your phone or Mac. Select GP-5 as the device. Wait for the device to appear, then tap to connect.

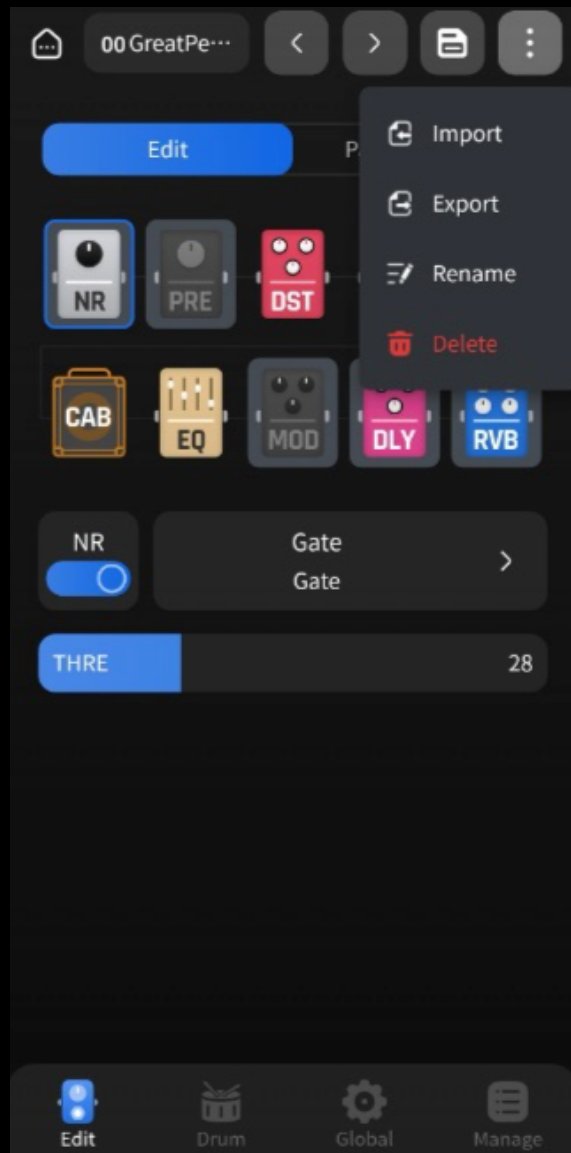

- 3) **Import NAM/SnapTone Files*** (if included in your pack). Once connected, click the 'N->S' icon. Then select 'import SnapTone File'.

Import the NAM files provided with your pack (max 10 at once). It is highly recommended to use empty slots if available. To import NAM files, click **IMPORT**.

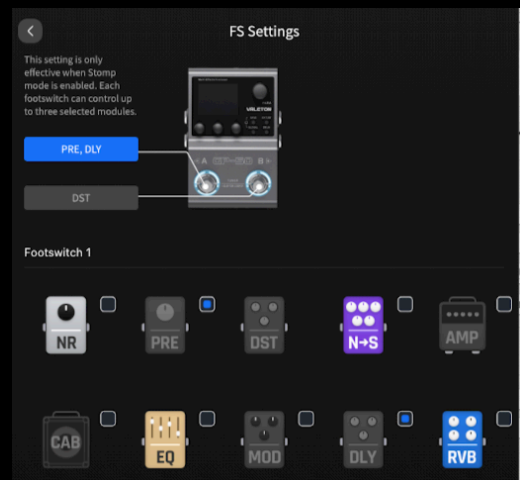

4) Importing Presets: Next step is to import presets included in a pack. In order to do that, go to the top right corner (3 dots), click, and hit IMPORT. After importing, the NAM file should be added automatically, but double-check to is everything is in place.

MAKE SURE TO IMPORT PRESETS FROM GP-50 PRESET FOLDER, NOT GP-5 PRESET FOLDER.

IMPORTANT: GP-50 allows you to control up to six effect modules in the effects chain simultaneously via footswitches (up to three effects per switch). Most patches are pre-programmed, but you can change how they behave in **Patch Settings** → **FS Settings**.

TROUBLESHOOTING:

My presets did not link to the corresponding nam file, what can I do?

In this case, make sure you upload the presets to the correct slots. For GP-5, use slots **50–59**, and for GP-50, use slots **55–64**. In the Starter Pack, NAMs should be imported right after the stock NAMs into the first available empty slots. If those slots are already taken, you can use the next available empty slots or assign them manually.

My presets do not sound like your presets:

We record our demos directly into a DAW (Reaper) using either the **USB-C output of the Valeton** or the **headphone output into an Audient EVO 16** (in stereo). There is no mixing involved.

One common issue is connecting the GP-5 or GP-50 directly to a guitar amplifier. Our presets are designed to be used with **headphones, studio monitors, or FRFR speakers**. If you are not using flat-response speakers, they will not sound correct.

If your presets sound drastically different, double-check your setup and feel free to reach out to us: kontakt@galtonestudio.pl

Enjoy Your Presets!
